protein similarity are described as 'unknown protein.'
The software programs used to predict genes include: Grall
(Informatics Group, Oak Ridge National Laboratory,
http://compblo.ornl.gov/Grail-1.3/),
GENSCAN (Chris Burge, MIT, http://CCR-081.mit.edu/GENSCAN.html),
NetGene2 (S.M. Hebsgaard, et al., CRS, Technical University of
Denmark, http://www.cbs.dtu.dk/services/NetGene2/) and
SplicePredictor (Volker Brendel, Stanford University,
http://gremlini.zool.lastate.edu/cgl-bin/Sp.cgl).
Genes encoding tRNAs are predicted by tRNAscan-SE
(Sean Eddy, Mashington University School of Medicine, St. Louis,
http://genome.wustl.edu/eddy/tRNAscan-SE/).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       51860 bp DNA linear PLN 27-DEC-2000

Genes with similarity to proteins in the databases are described in
'product' or 'note' qualifiers. Genes that have no significant
protein similarity are described as 'unknown protein',
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Kotani, H., Nakamura, Y., Sato, S., Asamizu, E., Kaneko, T., Miyajima, N. and Tabata, S.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Eukaryota; Viridiplantae; Streptophyta; Embryophyta; Tracheophyta; Spermatophyta; Magnoliophyta; eudicotyledons; core eudicots; Rosidae; eurosids II; Brassicales; Brassicaceae; Arabidopsis.

Submitted (11-DEC-2001) Clemson University Genomics Institute,
Clemson University, 100 Jordan Hall, Clemson, SC 29634, USA

NOTE: This is a "working draft' sequence. It currently

* consists of 8 contigs. Gaps between the contigs.

* are represented as runs of N. The contigs

* is believed to be correct as given, however the sizes

* of the gaps between them are based on estimates that have

* provided by the submittor.

* This sequence will be replaced

* by the finished sequence as soon as it is available and

* the accession number will be preserved.

* This sequence will be replaced

* the finished sequence as 30691 bp in length

* 32673 87321 contig of 1381 bp in length

* 87322 94650: contig of 7329 bp in length

* 94651 96734: contig of 7329 bp in length

* 96735 97792: contig of 1088 bp in length

* 96735 97792: contig of 1088 bp in length

* 97793 139678: contig of 1088 bp in length

* 97793 139678: contig of 1088 bp in length

                                                                                                                                 The present sequence is a cDNA encoding corn adenylylsulphate kinase (APS kinase), also known as adenosine-5' phosphosulphate kinase. This is obtained from clone p0016.ctscjd/drb, derived from corn pooled tassel shoots, p0016 cDNA library. APS kinase is a sulphate assimilation protein, that catalyses the conversion of adenosine-5' phosphosulphate (APS) to 3'-Phospho-adenosine-5' phosphosulphate (PAPS). This sequence is used as probe and primers to identify, obtain and synthesise sulphate assimilation proteins from other plants. It is also used to produce transpenic plants, that are useful for altering the expression levels of a sulphate assimilation protein. The APS kinase peptides are useful for producing antibodies, that are used to screen and isolate cDNA clones.

                                                                                                                                                                                 The present sequence is a cDNA encoding wheat adenylyIsulphate kinase (APS kinase), also known as adenosine-5' phosphosulphate kinase. This is obtained from clone wrl.pk0101.e2, derived from 7 day old light grown wheat root seedlings, wrl cDNA library. APS kinase is a sulphate assimilation protein, that catalyses the conversion of adenosine-5' phosphosulphate (APS) to 3'-Phospho-adenosine-5' phosphosulphate (APS); This sequence is used as a probe and primer to identify, obtain and synthesise sulphate assimilation proteins from other plants. It is also used to produce transgenic plants, that are useful for altering the expression levels of a sulphate assimilation protein. The APS kinase peptides are useful for producing antibodies, that are used to screen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      967 TTCACCCAAAGCAATGGCCAAGCAAGTTCTATGCTACCTTGAAGAAAACGGATATTTGCA 1026

The present sequence is a cDNA encoding soybean adenylylsulphate kinase (APS kinase), also known as adenosine-5' phosphosulphate kinase. This is obtained from clone sdp2c.pk013.all, derived from soybean developing pods, sdp2c cDNA library. APS kinase is a sulphate assimilation protein, that catalyses the conversion of adenosine-5' phosphosulphate (APS) to 3'-phospho-adenosine-5' phosphosulphate (PAPS). This sequence is used as a probe and primer to identify, obtain and synthasise sulphate assimilation proteins from other plants. It is also used to produce transgenic plants, that are useful for altering the expression levels of a sulphate assimilation protein. The APS kinase peptides are useful for producing antibodies, that are used to screen and isolate cDNA clones.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Adenylylsulphate kinase; Adenosine-5'phosphosulphate kinase; APS kinase; 3'-Phospho-adenosine-5'phosphosulphate; PAPS; sulphate assimilation; soybean; clone sdp2c.pk013.a11; transgenic plant; screen; antibody; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is a cDNA encoding corn adenylylsulphate kinase (APS kinase), also known as adenosine-5' phosphosulphate kinase. This is obtained from clone cen3n.pk008B.bl0, derived from corn endosperm, cen3n catalyses the conversion of adenosine-5' phosphosulphate (APS) to 3'-Phospho-adenosine-5' phosphosulphate (APS) to 3'-Phospho-adenosine-5' phosphosulphate (APS) to assimilation protein, that assimilation proteins from other plants. It is also used to produce transgenic plants, that are useful for altering the expression levels of producing authodies, that are used to screen and isolate cDNA clones.

The invention relates to isolation of coding sequences and/or genes involved in tolerance to environmental stress in plants. The sequences (AA298305-298365) are useful for producing a transgenic plant having enhanced tolerance or resistance to environmental stress conditions such as anaerobic, flooding, cold, dehydration, drought, heat stress or salinity. This is useful for producing improved yield, growth, also provides growth of crops in areas where they cannot grow without the induced commontal stress. Sequences from A. thalians that are involved in environmental stress conditions, and polynucleotide sequences from A. thaliana that are involved in environmental stress tolerance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             þλ
